1. Purpose, scope and users

The purpose of this document is to describe the process of identification, evaluation, and addressing of risks that arise from product utilization and production and design processes in [organization name] using FMEA (Failure Mode Effect Analysis).

Commented [16A5]: Adapt to organization's needs.

Users of this document are top management members of [organization name] within the scope of the QMS.

2. Reference documents

- IATF 16949:2016, clause 6.1
- Quality Manual
- Procedure for Determining Context of the Organization and Identification of Interested Parties
- Procedure for Addressing Risks and Opportunities
- [other documents and regulations that determine document control]

3. Risks assessment

The purpose of applying FMEA in the design process is to identify that the right materials are being used, to ensure the correct specifications, and to ensure that government regulations are being met before building the product design.

The purpose of applying FMEA in the production process is to identify any potential failures that could be caused by manufacturing processes, machines, humans, and production methods.

3.1. Appointing team for risk assessment

[Job title] appoints the team for risk assessment. The team has to be multidisciplinary; recommended [redacted] past problems, and similar products and processes.

Commented [16A6]: Adapt to organization's needs.

Commented [16A7]: e.g., product recalls, field returns and repairs, complaints, scraps, rework, etc.

It is also strongly recommended that at least one team member be qualified in the utilization of [redacted]

Commented [16A8]: Adapt here to your organization. Example: root cause analysis methods, statistics.

Responsibilities of the team for risk assessment include obtaining all necessary information, [redacted]

3.2. Inputs for FMEA

The team for risk assessment is responsible to perform the following:

[organization name]

- Review specifications for the product or service to be delivered or designed. The type of information reviewed includes the product models, equipment configurations, design specifications, and operating procedures.
- Collect all available information that describes the subassembly to be analyzed. Systems descriptions include equipment configurations, materials, and processes.
- Compile information on earlier/similar designs from in-house/customer users such as data from design and manufacturing records, test records, failure reports, and customer return orders. This may also be collected by interviewing the following design personnel: operators, testing, and maintenance personnel; suppliers; and outside experts to gather as much information as possible.

Commented [16A9]: i.e., equipment types, quantities, and redundancy.

Commented [16A10]: E.g., documents explaining user interface, instruction manuals for the product being designed, etc.

The above information should be collected and kept by [job title] as a single case history and provide enough detail to produce a design to replace the equipment configuration to the best required for safety.

3.3. Ranking criteria for FMEA

“Failure modes” means the ways, or modes, in which a production or design process component might fail. “Effects analysis” refers to studying the consequences of those failures.

The purpose of the ranking criteria is to determine which of the identified failure modes has the biggest impact on the customer satisfaction and quality of the product or service being produced or designed. Testing records and documents, the records of dealing with user return orders, finding the failure modes with highest ranking need to be recorded first.

According to FMEA’s scope – Product or Process, each item will be ranked using the following tables.

Commented [16A11]: Adapt to your organization’s needs. This is a general framework for establishing Severity, Occurrence, and Detection that is widely used worldwide. It is possible that your customer uses another system; therefore, adapt your internal procedure to that if requested.

3.3.1. Severity

Severity is the value associated with the most serious effect for a given failure mode. Severity is a ranking system used to evaluate the impact of the individual failure modes. Severity is defined as a scale of severity from 1 to 10. The severity ranking is used to determine the impact of the failure modes on the product or service. FMEA in production processes.

Commented [16A12]: Adapt the ranking system to organization’s needs, but the scale from 1 to 10 should be kept in order to ensure that the Appendix 4 – FMEA Risk Assessment Record is compliant with the methodology and avoid editing the Appendix 4.

Severity Scale	D FMEA Severity Definition
10 Hazardous - without warning	Very high severity ranking when a potential failure mode affects
9 Hazardous - with warning	Very high severity ranking when a potential failure mode affects
8 Very High	Vehicle or item inoperable, with loss of primary function.

[organization name]

7 High	Vehicle or item operable, but at a noticeable level of performance degradation with dissatisfaction.
6 Moderate	Vehicle or item operable, but Comfort or Convenience item(s) inoperable. Customer is dissatisfied.
5 Low	Vehicle or item operable, but noticeable level of performance degradation with dissatisfaction.
4 Very Low	Fit and Finish or Squeaks and Rattle item does not conform. Defect noticed by 25% of customers.
3 Minor	Fit and Finish or Squeaks and Rattle item does not conform. Defect noticed by 50% of customers.
2 Very Minor	Fit and Finish or Squeaks and Rattle item does not conform. Defect noticed by 75% of customers.
1 None	No noticeable effect.

Severity Scale	P FMEA severity definition when failure mode results in a consumer defect	P FMEA severity definition when failure mode results in a customer complaint
10 Hazardous – without warning	Very high severity ranking when a failure mode results in a consumer defect without warning.	Very high severity ranking when a failure mode results in a customer complaint without warning.
9 Hazardous – with warning	Very high severity ranking when a failure mode results in a consumer defect with warning.	Very high severity ranking when a potential failure mode may endanger the operator (machinery assembly) with warning.
8 Very High	Vehicle or item inoperable, with loss of primary function.	100% of product may have to be replaced or repaired in the repair department with a repair time greater than one hour.
7 High	Vehicle or item operable, but at a noticeable level of performance degradation with dissatisfaction.	75% of the repaired or replaced items may have to be repaired in the repair department with a repair time greater than one hour.

Commented [16A13]: The final customer should always be considered first. If both effects occur, use the higher of the two severities.

[organization name]

6 Moderate	Vehicle or item operable, but Comfort or Convenience not operable	A portion of the shipment of products may have to be sorted, with no scrap, and reworked.
5 Low	Vehicle or item operable, but Comfort or Convenience operable dissatisfied.	100% of the shipment of products may have to be sorted, with no scrap, and reworked.
	Fit and Finish or Squeaks and Rattle item does not conform.	Minor disruption to production line; a portion of the product (less than 100%) may have to be reworked on the line, in-station;
	Fit and Finish or Squeaks and Rattle item does not conform. Defect noticed by 50% of customers.	Minor disruption to production line; a portion of the product (less than 100%) may have to be reworked on the line, in-station;
1 None	No noticeable effect.	Slight inconvenience to operation or operator, or no effect.

3.3.2. Likelihood of the failure occurrence

The probability that a failure will occur during the expected life of the system can be described in

similar process, the data should be used to determine the failure occurrence ranking.

Commented [16A14]: For example once a year, once a month, once a week, etc.

Commented [16A15]: For example, if there are records from a

Table 3. Occurrence ranking of D FMEA and P FMEA

Occurrence scale	
10	> or = 100 / 1,000 produced parts
9	50 /1,000 produced parts

[organization name]

High: Repeated failure	8 20 / 1,000 produced parts
	7 10 / 1,000 produced parts
Medium: Repeated failure	6 5 / 1,000 produced parts
Low: Repeated failure	3 0.5 / 1,000 produced parts
	2 0.1 / 1,000 produced parts
Remote: Failure is unlikely	1 0.01 / 1,000 produced parts

3.3.3. Detection of failures

Detection of failures is a ranking based on an assessment of how easy it would be to identify or detect the failure for the failure mode given a design. The probability of detection of failures is ranked in reverse order, meaning the failures that are the easiest to detect are ranked with 1 and 10 and the failures that are the hardest to detect are ranked with 10.

Table 4. Detection ranking for D FMEA

Detection scale	D FMEA detection definition
10 Remote	Design Control will not detect a potential cause or mechanism and subsequent failure mode, or there is no Design Control.
9 Very Remote	<u>Very remote</u> chance the Design Control will detect a potential cause or mechanism and subsequent failure mode.
8	Design Control will not detect a potential cause or mechanism and subsequent failure mode.
7 Very Low	<u>Very low</u> chance the Design Control will detect a potential cause or mechanism and subsequent failure mode.
6	Design Control will not detect a potential cause or mechanism and subsequent failure mode.
5	Design Control will not detect a potential cause or mechanism and subsequent failure mode.
4	Design Control will not detect a potential cause or mechanism and subsequent failure mode.
3 High	<u>High</u> chance the Design Control will detect a potential cause or mechanism and subsequent failure mode.
2	Design Control will not detect a potential cause or mechanism and subsequent failure mode.
1 Almost Certain	Design Control will <u>almost certainly</u> detect a potential cause or mechanism and subsequent failure mode.

Detection scale	P FMEA detection definition	Inspection type
-----------------	-----------------------------	-----------------

[organization name]

10 Almost Impossible	Absolute certainty of non-detection – cannot detect.	Manual inspection
		Manual inspection
		Manual inspection
7 Very Low	Controls have a poor chance of detection – control is achieved with double inspection only.	Manual inspection
		Gauging
5 Moderate	Controls may detect – control is based on variable gauging after parts have left the station, or Go/No/Go gauging performed on 100% of parts after parts have left the station.	Gauging
		Error proofed and/or gauging
	Controls have a good chance to detect – error detection	Error proofed and/or gauging
2 Very High	Controls almost certain to detect – error detection in-station (automatic gauging with automatic stop feature). Cannot pass discrepant part.	Error proofed and/or gauging
	Controls almost certain to detect – discrepant parts	Error proofed

Commented [16A16]: Inspection performed by personnel, e.g. visual, tactile, haptic.

3.4. Conducting FMEA

3.4.1. Identifying process or production phases or components

[Job title] lists the process or production phases or components that correspond to each process step
 likely to have a negative impact on the product.

3.4.2. Identifying potential failure modes

Potential failure mode is defined as the manner in which the process could potentially fail to meet

Commented [16A17]: Failure mode in statistics has a certain statistical distribution, e.g., Exponential for machines.

When preparing FMEA for the

[organization name]

- incoming part(s)/material(s) are correct
- [redacted]

Exceptions from the assumptions can be made by the FMEA team where historical data indicate [redacted]

[Job title] identifies the potential failure modes by determining conditions when a specific [redacted] a symptom noticeable by the customer. Each requirement may have multiple failure modes. A large [redacted] not well defined.

3.4.3. Identifying potential failure effect

Potential effects of failure are defined as the effects of the failure as perceived by the customer(s).

[Job title] describes the effects of the failure in terms of what the customer might notice or [redacted] to regulations in the FMEA Risk Assessment Record.

For the end user, the effects should be stated in terms of product or system performance. If the [redacted]

3.4.4. Identifying potential cause/mechanisms of failure

A potential cause of failure is defined as an indication of how the failure could occur, and is described [redacted]

To the extent possible, the team for risk assessment identifies and documents, detailed as concisely [redacted] more causes that can result in the failure being analyzed.

3.4.5. Identifying current controls/fault detection

The team for risk assessment needs to identify process controls already present in the process.

[redacted]

- Prevention: Eliminate (prevent) the cause of the failure from occurring, or reduce its rate of occurrence.
- [redacted]

Commented [16A18]: For example, by asking himself what situations can lead to nonconforming product.

Commented [16A19]: e.g., as documented in the process flow diagram.

Commented [16A20]: The customer(s) in this context could be the next operation, subsequent operations or locations, the dealer, and/or the vehicle owner.

Commented [16A21]: Potential cause of failure may be an indication of a design or process weakness, the consequence of which is the failure mode.

The preferred approach is to first use prevention controls, if possible. The initial occurrence rankings will be affected by the prevention controls provided they are engaged in part of the process. The other detection rankings will be based on process controls that allow detect the cause of failure or detect the failure mode. New controls are introduced according to chapter 3.6.

3.5. Determining Risk Priority Number (RPN)

The RPN is the critical indicator for determining proper corrective action on the failure modes. The RPN is calculated by multiplying the severity of the occurrence (S), and detection ranking (D) and occurrence ranking (O) as follows:

$$RPN = Severity \times Occurrence \times Detection$$

[Job title] calculates the RPN and makes prioritization of potential failures to be dealt with. The failures with the highest RPNs are first to be dealt with.

3.6. Corrective Actions

According to RPN, the team for risk assessment proposes corrective actions. The intent of any corrective action is to reduce rankings in the following order: severity, occurrence, and detection.

The nature of the corrective action proposed by the team for the risk assessment should address the root cause of the failure mode in the following order:

1. To Reduce Severity (S) Ranking:

Only a design or process revision can bring about a reduction in the severity ranking. A design or process change should be implemented early in the development process. For maximum effectiveness and efficiency of this approach, changes to the product and process design should be implemented early in the development process.

2. To Reduce Occurrence (O) Ranking:

To reduce occurrence, process and design revisions may be required. A reduction in the occurrence ranking can be affected by removing or controlling one or more of the causes of the failure through a design or process change. Further, the knowledge gained may assist in the identification of suitable controls to reduce occurrence. Further, the knowledge gained may assist in the identification of suitable controls to reduce occurrence.

3. To Reduce Failure Detection (D) Ranking:

The preferred method is the use of error/mistake proofing. A redesign of the detection methodology may be required to increase the likelihood of detection. Generally, improving detection controls

Commented [16A22]: For example, process technology needs to be considered very early in the process development if severity is to be reduced.

Commented [16A23]: i.e., reduce the detection ranking.

[organization name]

requires the knowledge and understanding of the dominant causes of process variation and any special causes.

3.7. Reporting

All data obtained in the process of risk assessment are entered in the FMEA Risks Assessment Record
[to be completed by the responsible for reporting to all relevant functions in organization]

3.8. Review

After implementation of corrective actions, the team for risk assessment reviews the effects of the
corrective actions and records in the risk assessment to determine the new condition of the
process being analyzed and to define new risks.

4. Managing records kept on the basis of this document
